EDUCATION

Vidyavardhaka College Of Engineering, **Expected : 2026**

Bachelor of Engineering *CGPA : 8.49*

SKILLS

Languages and Database: Java, JavaScript, HTML/CSS, Mongo DB.
Technologies and Frameworks: ReactJS, NextJS, NodeJS, ExpressJS, GSAP, WebSocket.
Design and Prototyping Tools: Figma, Sketch, Spline, Framer.
Development Tools: VS Code, Git/Github, Postman.

EXPERIENCE

Artificial Intelligence intern, *IBM SkillBuild*

Remote|Mysore, India| **July 2024 – August 2024**

- Implemented **MedBuddy,** an AI-powered web application with an intuitive interface for seamless client navigation using **HTML**, **CSS**, **JavaScript**, and **MongoDB**.
- Also Integrated an AI ChatBot using **DialogFlow** to provide real-time assistance, enhancing user experience and reducing support response time.

PROJECTS

Estoria – Real Estate Management Web Application | LINK **December 2024**

- Worked on a **minimalistic real estate management application** using **HTML, CSS, JS** to manage property listings, user authentication, and data storage efficiently.
- Implemented **CRUD operations** for property management, ensuring a responsive and user-friendly interface while maintaining secure data handling with **MongoDB** and **Node.js**.

PennyPilot – Modern Expense Logging App | LINK **January 2025**

- Developed a responsive web application using **React** (Vite), **Tailwind CSS**, and **WebSocket** technology to enable users to seamlessly log, categorize, and analyze their personal expenses in real-time with a very clean UI.
- Enabling **real-time data updates** with WebSocket, providing users with instantaneous feedback and **interactive charts** for a dynamic experience, improving user engagement and financial decision-making.
- Employed **MongoDB** to design and manage the application's database, ensuring secure and efficient storage of user data while maintaining seamless data retrieval during every user operation.

EcoSnap: AI-Powered Waste Classification System | LINK **February 2025**

- Undertaking on an AI-based waste segregation tool using **Image Recognition** and **Speech-to-Text** technologies to enable real-time waste classification and improve environmental sustainability efforts.
- Integrated **MobileNetV2** for efficient image classification and **BERT** for natural language processing to provide accurate waste categorization, enhancing the tool's AI capabilities.
- Alongside **Location-Based Disposal Guidance**, offering users tailored suggestions for proper waste disposal based on their geographical location, promoting eco-friendly behavior.
- Built the application using **React** (Vite), **TypeScript**, **Tailwind CSS**, and **FastAPI**, ensuring a modern, responsive user interface and optimized backend performance.

ACHIEVEMENTS

1. Assisted athletes in identifying and overcoming gameplay challenges, developing critical thinking and problem-solving skills both in-game and in broader strategic contexts.
2. Secured 5th position in a hackathon by developing an innovative solution that addressed a common daily problem, demonstrating problem-solving skills, creativity, and technical expertise.
